

Generator Noderplate

Generate Node.js starter files with
just one command!

Problem Statement: Developer Tools

General Problem

- Usually, node js developers had to install certain NPM packages that are common in almost all of the projects.
- In order to set up their project folder structure, they had to mention, all the required packages in a package.json file and certain lines of code in index.js (which is repetitive in nature w.r.t every other project they build).
- A developer who constantly works with node js in multiple projects at a time has to perform these steps repetitively.

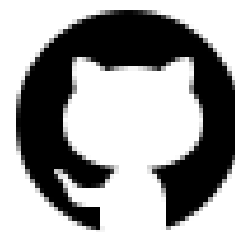

Our Solution

- We have developed a NPM package which will help developers like us to generate boilerplates for various packages they need in their project.
- This boilerplate will be generating all the required files and folders required.
